

RoadMag Instructions

Mount unit level
with ground
1-1/2" - 3"
from surface.

Speed of travel as well as mounting height greatly affects the **RoadMag's** performances. The recommended operating speed is from 2-4 m.p.h., depending on terrain and the type of objects the unit is "sweeping".

Even the most powerful magnets will fail to attract steel - iron objects if the operator is driving too fast.

Excessive buildup of magnetic particles will reduce the unit's efficiency. Wipe the unit clean with a cloth or glove and the **RoadMag's** magnetic power will return to normal.

**Avoid banging or scrapng the unit against the ground
which could damage the internal magnet assembly.**
